Directional Drilling

• The art and science of drilling a wellbore along a *predetermined* trajectory.
• The tools and techniques used are determined by the complexity of the well path and the desired precision of the attempt to follow that trajectory.
Relief wells
Controlling vertical wells
Inaccessible locations
Fault drilling
Re-entry/Multi-lateral wells
Reentering Existing Wells

- Medium radius requires completion in shale
- Original well
- 7- or 5-in. line
- Short radius drains 6\(\frac{1}{4}\)in. – 4\(\frac{1}{4}\)in.
**New: Greatest Deviation.** Smedvig’s semisubmersible West Vanguard has set a new world record for deviated drilling. In Norsk Hydro’s gas injection well No. 6407/7-A-8H out on the Njord field, the West Vanguard crew achieved a deviation of 139° from vertical for the 9½-in. hole, using a conventional drill string with a Lyng LA 250BZ PDC drill bit and a 6¾-in. Mach 1 XL motor with a 9½-in. SOS bearing housing stabilizer. The well was drilled to a vertical depth of 8,999 ft (2,742 m) with a TD of 11,893 ft (3,625 m) in 1,083-ft (330-m) water depths. An average of 3.8° per 30 m DLS was required throughout the run, and this was achieved without oriented drilling.
Reference Systems and Coordinates

- **Depth Reference**
  - True Vertical Depth (TVD)
    - Pressure calculations
  - Measured Depth (MD)
    - Volume calculations
    - Geolograph

- **Reference Points**
  - Ground level (GL)
  - Rotary kelly bushing (RKB)
  - Rotary table (RT)
  - Rig floor (RF)
Inclination

- **Inclination (Drift)**
  - The angle (in degrees) between the local vertical (local gravity vector as indicated by a plumb bob) and the tangent to the well bore axis at a particular point.
  - By oilfield convention, 0° is vertical and 90° is horizontal.
Azimuth

- **Azimuth (hole direction)**
  - The azimuth of a borehole at a point is the direction of the borehole on the horizontal plane, measured as a clockwise angle (0°- 360°) from the North reference.
  - All magnetic tools give readings referenced to magnetic north; however, the final calculated coordinates are referenced to either true north or grid north.
Target

Driller: relative to borehole direction
Geological: relative to geology

Bigger is easier to hit
Radius Definitions

- **Long Radius**
  - 2° - 6° /100 ft
  - 3000 - 1000 ft radii

- **Medium Radius**
  - 6° - 40° /100 ft
  - 1000 - 140 ft radii

- **Intermediate Radius (Flex Motors)**
  - 40 - 70°/100 ft
  - 140 - 82 ft radii

- **Short Radius (Articulated Motors)**
  - 70 - 150°/100 ft
  - 82 - 40 ft radii

- **300 - 3000 ft**

- **1500 - 4000 ft**

- **2000 - 6000 ft**

Reach
Wall Force

• **Force of tool joint against borehole wall**
• **According to A. Lubinski,**
  - Keep WF less than 2,000 lbf in water based muds
  - Keep WF less than 3,000 lbf in non-aqueous based muds
• **Problems from wall contact**
  - Casing wear
  - Drill pipe wear
  - Fatigue failure
  - Keyseating

\[
WF = 2T \sin \left( DLS \frac{L_j}{2} \right)
\]

\[
L_j = \text{length of joint}
\]
Survey Techniques

- Find inclination and azimuth at various points along the wellbore
- Usually get
  - Inclination (from vertical)
  - Azimuth (from north)
  - Measured depth (from RKB, GL, etc.)
Surveying Data Gathering Techniques

- Simple drift
- Photographic film
  - disks / strip
- Memory modules
  - multi-shot / MWD
- Wireline
  - surface readout
- Mud pulse telemetry
  - MWD
Simple Drift

- Every rig has a simple drift
- Only measures inclination
  - No azimuth information
- Sometimes dropped right before a trip
- Sometimes run on slick line
- Operates on a pendulum
  - Timer
  - Punches paper disk (twice at 180° separation)
Magnetic Single-Shot

- **Function**
  - Provides photographic record of inclination, direction and toolface orientation at a single point in the open hole section of the well

- **Limitations**
  - Requires non-magnetic drill collars
  - Temperature
  - Must re-run to confirm changes in toolface
Electronic Multi-Shot

• Function
  – Records inclination, direction and toolface
  – Records raw magnetic and gravity field data
  – All data electronically measured and recorded

• Limitations
  – Needs non-magnetic drill collars
  – Temperature
MWD/LWD Measurements

- **Inclination aka:** drift, slant, angle
- **Azimuth aka:** direction, compass heading
  - Gravitational and magnetic field sensitivity
  - Magnetic dip angle
- **Drilling operating parameters**
  - Torque
  - Weight on Bit (WOB)
  - Pressure
- **Tool face orientation** (which way is the bit pointed)
- **Sensor temperature**
- **Formation evaluation measurements**
  - Gamma Ray, resistivity, density, neutron, sonic, pressure
Geosteering

- A technique used to direct a wellbore path
  - in terms of geologic features
  - not in terms of simple geometric constraints
- Requires close cooperation of geologist and drilling engineer
- Use of LWD and MWD helps determine a path through a formation while drilling

- To apply, need to have:
  - Knowledge of log response of formation(s)
  - Experienced personnel
  - Good MWD and LWD equipment

- Useful in
  - Reservoirs that are thin and/or complex
  - Medium to short radius horizontal wells
Survey Errors

• Two types
  – Systemic – regularly occurring and are not compensating
  – Random – irregularly occurring

• Reading errors
• Mechanical malfunctions
• Calibration errors
• Instrument alignment
• Drillstring measurement
• Inherent math approximations
• Natural magnetic interference
• Hot spots
• Numerical calculations and data recording
• Gyroscopes
  – Drift
  – Precession
  – Orientation

Spider Plot (Platform Hogan)

About \(5,000\)’
Anti-collision

- Major versus minor risk
  - Major – significant risk to people and environment
  - Minor – negligible risk
- Wellbore may have multiple risks
- Separation based on company rules (10 m)
- Anti-collision diagram
  - Traveling cylinder plot with tolerance lines
  - Preplanned trajectory
- Used in the field
  - Don’t cross the tolerance line

Technology Overview

- **Build Rate (deg./100’, deg/30m)**
  - **Long**
    - M1XL Motors
  - **Medium**
    - M1X Motors
  - **Intermediate**
    - Collar (Primary Application)
    - Probe (Secondary Application)
    - Flexible (Secondary Application)
  - **Short**
    - Articulated Motors
  - **Radius (ft.)**
    - 1000
    - 140
    - 80
    - 40
  - **Radius (m)**
    - 300
    - 43
    - 25
    - 12

- **Tool Type**
  - M1XL Motors
  - M1X Motors
  - Collar

- **MWD Type**
  - Conventional
  - Flexible (Primary Application)
  - Composites
  - Special
  - Project Specific

- **Pipe Rotation**
  - Premium - Limited Rotation
  - Slide Drill - No Rotation

- **Completions**
  - Conventional - No Restrictions
  - Special
  - Project Specific
Side Force and Tilt Angle

- **Side Force at Bit**
- **Hole Gauge**
- **Resultant Force at Bit**
- **Side Force at Stabilizer**
- **Hole Axis**
- **Formation Anisotropy**
- **Bit Tilt Angle**
Dip Angle and Deviation Force

Hole Inclination $= 30^\circ$
Real Dip Angle $= 35^\circ$
Effective Dip Angle $= 30^\circ + 35^\circ = 65^\circ$
There will be a down-dip deviation force

Hole Inclination $= 0^\circ$
Real Dip Angle $= 35^\circ$
Effective Dip Angle $= 35^\circ$
There will be a up-dip deviation force

Hole Inclination $= 35^\circ$
Real Dip Angle $= 35^\circ$
Effective Dip Angle $= 0^\circ$
There will be no deviation force

Asymmetric rock failure still deviates borehole.
Oriented Mode (Slide)

- **Wellbore Trajectory**
  - Controlled curvature
  - Controlled direction
  - No drill string rotation
Rotary Mode

- Wellpath
  - Behavior same as a rotary drilling assembly
  - Hole slightly over size
Influences on Direction

Stabilizer

(a) (b) (c) (d)
Torque and Drag

• Higher with
  - Any directional change
  - Undulations (mini-doglegs)
  - Thick mud cake
  - Ledges
  - Non-lubricating mud
  - Cuttings beds
  - Swelling formations

• Affects
  - Available WOB
  - Available TOB
  - Margin of overpull

• Changes with
  - Running in the hole
  - Pulling out of the hole
  - Sliding
    • Axial drag
    • Lock up
  - Rotation
Torque and Drag Example

[Graphs showing torque and drag example for Well No. 3, with labels for tension in drill string (x 1000 lbs) and measured depth (ft).]
Buckling

- Load starts bending the pipe
- When load reaches critical point, buckling starts
- Starts as sinusoidal shape laying on bottom of borehole
- More load starts the pipe snaking up the sides of the borehole
- Eventually, pipe winds into a helical shape (spring shaped)
- Lock up occurs
Mud Weights for Directional Drilling

- Mud Weight Increasing
- Deviation Increasing

Unstable

Hole Collapse
Fracturing

Mud Weight Increasing >
Cuttings Beds

- Laminar cleaning
- 0 to 25 degrees
- 25 to 65 degrees
- > 65 degrees
- Turbulent cleaning
- Cuttings bed
Drill Pipe Stress

Tension due to hookloads

Bending

Compression

Torsion

Tension
t due to drill collars
Cementing Issues

- **Annular settling**
  - Free water on highside

- **Centralization**
  - Difficult to achieve

- **Reciprocation**
  - May not be possible
Directional Drilling Planning

- Surface coordinates
  - Latitude and longitude
  - Local grid coordinates
- Target
  - TVD
  - Boundaries
- Limitations
  - Lease lines
  - Other wellbores
- Hole and casing sizes
- Casing points
- KOP
- Maximum build and drop rates

- Geology
- Mud weights and type
- Offset information
  - Directional performance of BHA
  - Dips
- Geological sequence
- Rig information
  - Drill string
  - Mud Pumps
  - Mast strength
- Well profile
- Offset histories
Wellbore Profile

• S-profile more difficult than slant profile
  - More hole to be drilled
  - Drop off restricts WOB and rate of penetration (ROP)
  - Not as responsive to directional control
  - More drag

• S-profile used when:
  - Intermediate targets
  - Wellbore must be vertical in reservoir
Horizontal Drilling

• Any 90° hole
• Technology has caught up with idea
• Continuous improvements
  – Directional control
  – Reduced costs

• Utilizes
  – Geosteering
  – MWD and LWD
  – Underbalanced drilling

• Reservoir analysis techniques are starting to catch up with drilling technology
Requirements for Horizontal Boreholes

• Hit the target
• Smooth turns and builds for long reach
• Gauge borehole for problem-free drilling
• Minimal formation damage
• Reasonable cost
Approaches to Horizontal Drilling

**Diagram:**
- **Vertical Well:**
- **Conventional Radius:** 2000 ft
- **Medium Radius:** 286 ft
- **Short Radius:** 40 ft
- **Very Short Radius:** 2 ft

**Table:**

<table>
<thead>
<tr>
<th>Type</th>

</tbody>
</table>
Multilateral Drilling

- **Multilateral wells**
  - Single trunk
  - Multiple laterals (sometimes called branches or drainholes)
  - Can be vertical, horizontal, or deviated

- Able to reach multiple targets in same formation
- Laterals can be completed separately
- Large drainage area for small environmental footprint
- Difficult to operate
  - Operations
  - Stimulation
  - Production

- Potentially expensive
Extended Reach Drilling

1 Mile Deep

6.3 Miles (33,184 ft) Displacement

1605 m
Extended Reach Drilling

- Long near-horizontal borehole
- Useful for environmentally sensitive areas
  - BP at UK Wytch Farm field
  - Up to 10 kilometers (6.2 miles)
- Only one location
  - Minimizes rig footprints

- Issues
  - Torque limitations
  - Hole instabilities
  - Cuttings transport
  - Not horizontal
  - Cannot slide
  - Equivalent circulating density (ECD) high
  - Casing running
    - Floated?
  - Swab and surge
Directional Drilling Costs

- Additional costs for directional drilling equipment
  - Mud motor, MWD, people, etc. $10,000/day

- Rig may need to be larger making for a larger location
  - Larger mud pumps, need more flow

- Casing and tubing design
  - Ovality and bending stress

- Additional mud cost and solids control equipment
  - Mud weight is usually higher
  - Cuttings bed development

- Additional borehole risk
  - Tectonic stress directions

- Slower ROP, more time on location

- Torque and drag higher
Thank you.

Any Questions?
